DIAGNOSIS: calcaneovalgus foot left greater than right with underlying L4 myelodysplasia, status post left foot calcaneal osteotomy with lateral column lengthening and medial reefing June 17, 2009.

HISTORY: Brady is now six weeks out from his surgery. He has been in a walking cast while his brace was being made.

Today on physical exam his clamshell AFO looks great. It is fitting well. His incisions were checked. They are pristine. The foot is nice and straight. I had him stand in his new brace and take some steps around the exam room. He stated things felt funny because now his foot is straight but there was no pain. The toes were warm, pink and well-perfused.

Impression is doing very well six weeks out from the above-mentioned surgery.

PLAN: Brady may weightbear as tolerated on his brace and the mom knows to check the skin frequently for irritation. He may be seen next in conjunction with Dr. Emans in four to six months. At that
