

EAGLE-I USER RESEARCH

Animal Models & Human Health Studies

SUMMER STREET DESIGN
JONATHAN ABBETT · EVAN PANKEY

THE PLAN

Review research process
Discuss human health results
Discuss animal model results

Followed by Part 2: Design Recommendations

RESEARCH FOCUS

Mouse models
Human health studies
[Cores]

KEY QUESTIONS

How do researchers currently find and use animal models?

How do human health researchers collaborate? Do they exchange data?

What are the incentives or requirements to share?

How do cores support their efforts?

SITE FOCUS

ALASKA	Human health studies
DARTMOUTH	Animal models
HARVARD	Animal models, human health studies
HAWAII	Animal models, human health studies
JACKSON STATE	Animal models, human health studies
MONTANA	Animal models, cores
MOREHOUSE	Animal models, human health studies, cores
OREGON	Animal models
PUERTO RICO	Animal models

SITE FOCUS

ALASKA	Hopkins, Bersamin
DARTMOUTH	Berwin, Fiering, Turk
HARVARD	Rosen, Cypess, Wall, Liu, Linder
HAWAII	Hoffman, Erdem, Pitts, Feger
JACKSON STATE	Patlolla, Hwang, Arslan, Sarpong, Taylor
MONTANA	Swain, Voyich-Kane, Wiley, Rynda, ARC
MOREHOUSE	Champion, Gibbons, Emmett, Rust
OREGON	Kohama, Winn
PUERTO RICO	Segarra, Pérez [2/26]

FINDINGS

HUMAN HEALTH STUDIES

"I do survey work and have small data sets. No one has ever asked me to share."

"We don't have restrictions but there are policies and procedures like confidentiality and data sharing agreements. Once those steps are taken, they can get access."

"We have data sets from the federal government which are very restricted."

"Data sets should be documented or annotated well so someone unfamiliar can use the data."

"I think sharing data automatically increases scientific productivity."

"The question is: if we put in, what do we get back?"

CATHLEEN / COMMUNITY HEALTH RESEARCHER

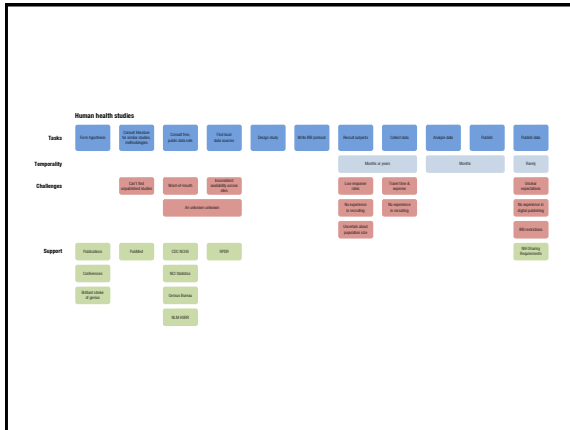

Builds trust within target communities
 Weary of untoward collaborations
 Wants to learn from work of others
 Asks permission meticulously
 Very careful about data security
 Has never shared her data

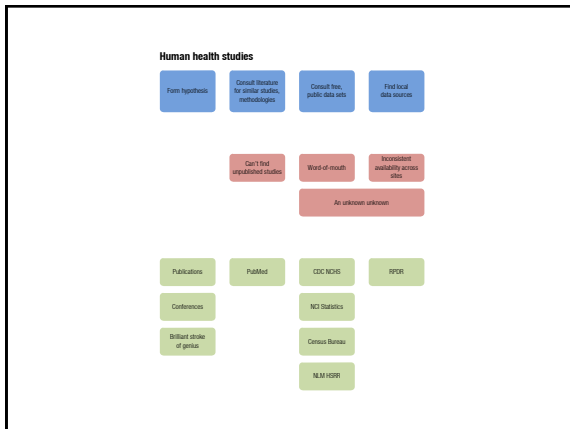

HOWARD / HEALTH SERVICES RESEARCHER

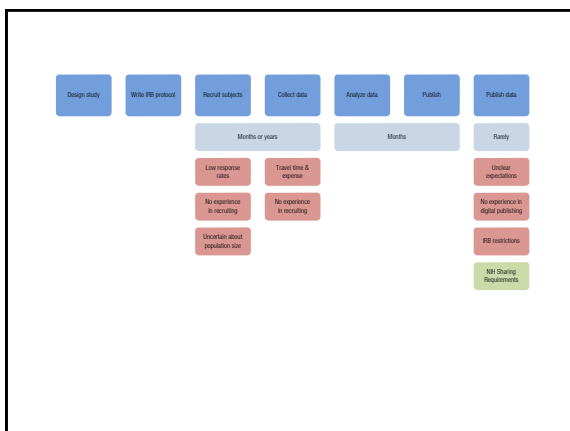

Must balance desire for collaboration
 with restrictions on data usage
 Recommends public data sets to junior
 colleagues
 Would like better access to live data and
 appropriate analysis tools
 Wonders about emerging data sets

IVAN / INFORMATICIST

Believes in a community approach to
 data curation and analysis
 Translational collaborations with
 clinical researchers helps grant
 prospects
 Openness to sharing not as common
 outside informatics circles
 Hard to find emerging data sets

FINDINGS

MOUSE MODELS

"Authorship is currency of science."

"Shared authorship is a big way to build collaborations."

"Everyone knows the rules around sharing published materials, but they're not always followed."

"I know I can get things from my colleagues, collaborators and their collaborators."

"We found that a group we didn't know about had created a construct very similar to our own. Those kinds of things are hard to know from the literature."

"I have to ask investigators whether they have a particular strain [of mouse] that I'm looking for."

"We don't know what strains are here. There a lot of labs with a lot of transgenics."

"It's all through the grapevine."

"If I'm thinking about a new piece of equipment, I ask myself if anyone in my core research group has it. If they don't we might get together and buy it."

"My technician has built a nice little system to manage our mice across complex breeding cycles. I let other people know that I had this system, but they were not interested."

"I created two Excel sheets that have really help me manage my mice."

"We are reaching the limits of using Excel to manage our mice."

"I haven't used them, but I know there are lot of tools on the web."

CAROLINE / MOUSE CREATOR

Knows she needs to share
Shares before publishing
Careful about authorship
Creates mouse "mirrors"
Transfers mouse to private lab
Managing requests and transfers is time consuming
Gets requests even after hand-off

SANDRA / SMALL SCHOOL RESEARCHER

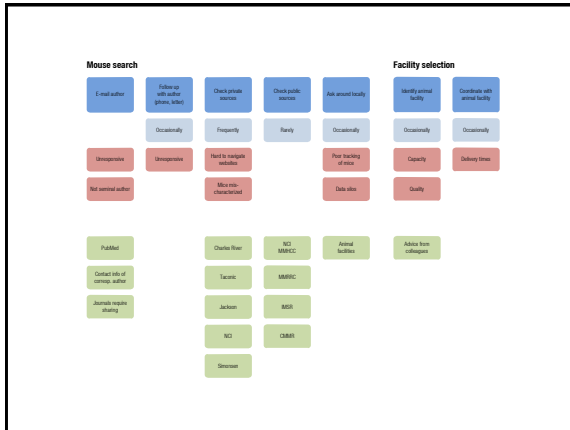

Knows entire science faculty
Attends conferences to expand professional network
Shares her models to build clout
Certain local resources lacking
Wants cores to operate like businesses
Has spent little time organizing

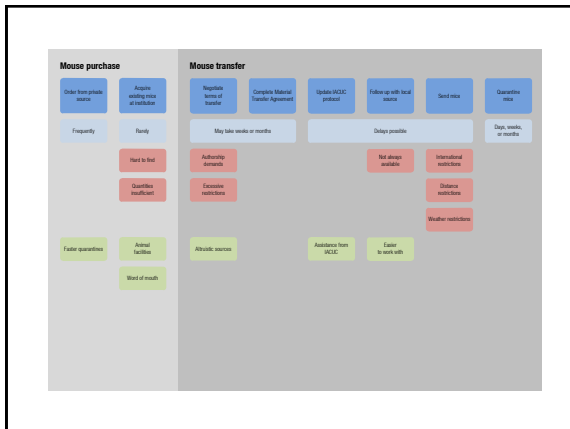

CALVIN / MOUSE CONSUMER

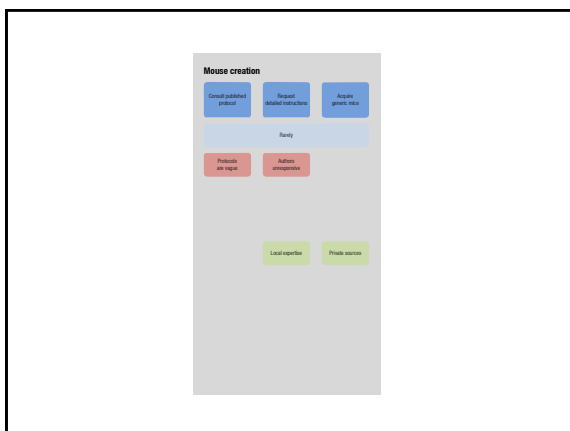

Follows literature, attends conferences
 Cultivates professional network
 Efficient with lab resources
 Authors can be non-responsive
 Hard to find true source of mice
 Buys private mice if available
 Cutting-edge models are more challenging, but can be worth it

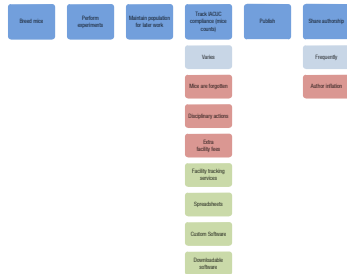

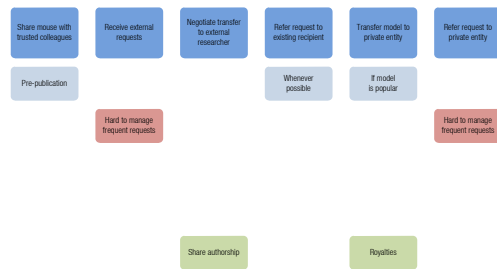

Mouse discovery

Mouse use

Mouse creation

Part 2

**DESIGN
RECOMMENDATIONS**

KEY CHALLENGES

Sustainability

Data half-life

Academic vs. market culture

Discordant sharing expectations

Scant lab organization

LinkedIn

Academic Norms

Google

Market Norms

APPROACH

Hook into institutional workflows

Pain points in research workflows

RECOMMENDATIONS

HUMAN HEALTH STUDIES

UNCLEAR SHARING EXPECTATIONS

"Muddy Boots" data collectors (primary)

Few incentives, privacy concerns

Populations researchers (secondary)

Willing, but institutional restrictions

Informaticists (tertiary)

Sharing, eager to share more

NIH DATA SHARING POLICY

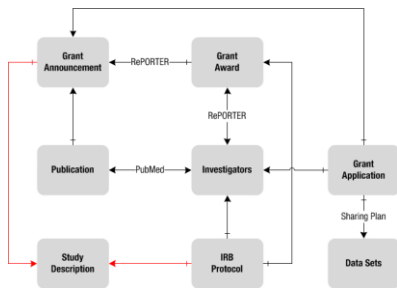

"NIH believes that **data sharing is essential** for expedited translation of research results into knowledge, products, and procedures to improve human health. NIH **endorses the sharing of final research data** to serve these and other important scientific goals and expects and supports the timely release and sharing of final research data from NIH-supported studies for use by other researchers."

"Investigators submitting an NIH application seeking \$500,000 or more in direct costs in any single budget period are **expected to include a plan for data sharing** or state why data sharing is not possible."

NIH DATA SHARING POLICY

"NIH recognizes **that data sharing may be complicated or limited**, in some cases, by organizational policies, local IRB rules, and local, State and Federal laws and regulations."

"The rights and privacy of individuals who participate in NIH-sponsored research must be **protected at all times**. Thus, data intended for broader use should be free of identifiers that would permit linkages to individual research participants and variables that could lead to deductive disclosure of the identity of individual subjects."

4. Funding Information		
a. Funding Source	b. Type*	c. Grant Number
<input type="text"/>	<input type="text"/>	<input type="text"/>
d. Title of Grant or Funding Application		
<input type="text"/>		
g. Plan for Confidentiality of Data		
<input type="text"/>		
h. Plan for monitoring of data for the safety of participants:		
Include the individuals reviewing the data (such as a Data Safety Monitoring Board (DSMB)), the data being reviewed, the frequency of review, and the rules for interim analysis for safety (such as statistical considerations and stopping rules), and reporting of adverse findings to the CHS.		
<input type="text"/>		
i. Use of Study Results		
<input type="text"/>		

5. Data Source Information	
a. Please indicate the source(s) of data for this study (mark all that apply)	
<input checked="" type="checkbox"/> Interviews	<input type="checkbox"/> Focus groups
<input type="checkbox"/> Other	<input type="checkbox"/> Medical records
<input type="checkbox"/> Questionnaires/surveys	<input type="checkbox"/> Public records
<input type="checkbox"/> Paper copies	<input type="checkbox"/> Photos/Videos
<input type="checkbox"/> Registries	<input type="checkbox"/> Voice recordings
<input type="checkbox"/> Biological specimens	
b. Will these data be linked to participants/cases or contain any personal identifiers? <input type="checkbox"/> Yes <input type="checkbox"/> No	
c. If the data are de-identified, will the study personnel have any linkkeys to identifiers? <input type="checkbox"/> Yes <input type="checkbox"/> No	
d. If the data are not de-identified, when will identifiers be removed? <input type="checkbox"/> Yes <input type="checkbox"/> No	
e. Are any of the data coming from covered entities under Health Insurance and Portability and Accountability Act (HIPAA)? <input type="checkbox"/> Yes <input type="checkbox"/> No	
f. If yes, describe*	
(i) Is there a data use agreement? <input type="checkbox"/> Yes <input type="checkbox"/> No	
(ii) Has a data use agreement been signed by HHS Sponsored Programs Administration? <input type="checkbox"/> Yes <input type="checkbox"/> No	
(iii) Is a HIPAA Waiver of Authorization being requested? <input type="checkbox"/> Yes <input type="checkbox"/> No	
<small>The HIPAA Waiver Form is available on the HHS/SCM IRB website</small>	

IRB INTEGRATION

Extract contact information, grant number

Scrape grant description, keywords, NIH project ID from grant number

Combine with contact information to create "study description"

IRB INTEGRATION

Data does not reveal proprietary info

Facilitates search for similar research by grant topic, PI, and study type

INTEGRATION SCENARIO

Paul needs IRB approval to study human subjects in an upcoming project. As negotiated between the IRB and the local Eagle-i team, the IRB extracts study type and grant information from the protocol, along with Paul's contact information, and includes it in a regular report sent automatically to the Eagle-i database.

Eagle-i combines that information with the keywords of the project's grant announcement to create a "Study Description" that can be indexed and retrieved through search.

FIND HUMAN RESEARCHER LIKE ME

Given the sensitive nature of Cathleen's research area, and the geographic obstacles to rural research, it's hard to recruit reliable subjects. She'd love to consult with other investigators in similar situations to find novel approaches to these challenges. She opens the Eagle-i website and searches for prospective cohort studies of rural populations. Eagle-i returns several hits.

Each hit provides a Primary Investigator's contact information and an excerpt of the grant funding his research. Cathleen uses this information to decide which PIs to e-mail.

FIND CONNECTION TO RESTRICTED DATA

Put off by the tedium of traditional chart reviews, Paul brings up the Eagle-i website to find data resources that might help.

He's not sure exactly what to search for, so he uses the browsable directory of resources to find a list of data sets and tools. The directory clues him into RPDR, a clinical data repository accessible only to researchers affiliated with Partners Healthcare in Massachusetts. Though he can't access the system himself, he recalls a colleague with whom he trained that's affiliated with Massachusetts General Hospital. Paul e-mails his old colleague to propose a collaboration using the RPDR data.

INCLUDE EAGLE-I IN DATA SHARING PLAN

Jeff submits a draft of his grant application to his university's Office of Sponsored Programs. They respond with several recommendations for improvement, including a suggestion to use Eagle-i to fulfill the grant's data sharing requirements. Jeff learns that Eagle-i will provide a free repository for his project's research data, including a unique URL that can be related to any PubMed IDs of journal articles he publishes. Since he's never published his data online before, and lacks the technical skills to do it himself, he includes the Eagle-i repository in his grant application's Data Sharing Plan.

PUT DATA ONLINE

Upon completing his research, Jeff prepares his data for archiving.

Jeff loads the eagle-i website and follows a simple, multi-step wizard to load his data set into the repository. Along the way, he indicates the source and agency identifier of his research's funding, as well as the PMIDs of a paper he published about the research.

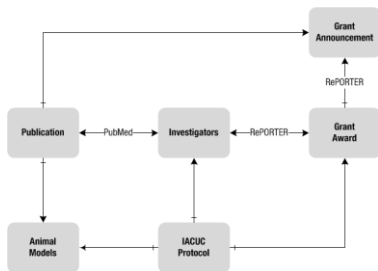

When the process is complete, Jeff is given a unique URL for his data set that he can include in future publications, in his CV, or share with colleagues.

FIND A DATASET

David's mentor recommends that he use the NHANES data set. Unfamiliar with the resource, he searches for "NHANES" in Google... He sees an NHANES hit from the eagle-i website. Clicking through, he reads some summary information about NHANES, plus a list of several data sets uploaded by other investigators that contain similar information. He's able to find two promising sets that pertain to obesity – using them will eliminate some of the patient recruitment and data collection he'd normally have to manage himself.

RECOMMENDATIONS

ANIMAL MODELS

Principal Investigator: _____

Protocol Number: _____

Protocol Title: _____

Protocol Contact Person, E-Mail Address and Phone Number (if not PI): _____

Research Team

(please provide the name(s), title(s), qualifications/years of experience for each person working with animals on this protocol)

Funding Information (check all that apply)

☐ Current Grant (specify granting agency and agency number): _____

☐ Pending Grant (specify grant agency): _____

☐ Other (specify): _____

Just-in Cost Center Number (if applicable, list all cost-centers that apply)

Species to be Used (check one, only one per application)

☐ Mouse

☐ Rat

Animal Housing (check all that apply)

☐ Fifth Floor – Barrier

☐ Fifth Floor – Conventional

☐ Basement

☐ Other (specify): _____

Number of Animals Used in the Past Year: 80

Estimated Number of Animals to be Used in the Up-Coming Year: 120

Estimated Length of Stay for Animals: 80

IACUC INTEGRATION

Use IACUC protocols to know who is using what mice

Extend protocol form to request specific models, sources

IACUC INTEGRATION

Protocols updated regularly

Layer on visibility restrictions

Inside/outside

Published/unpublished

LAB ORGANIZATION

Ad-hoc, home-grown

Excel-based

Infrequently updated

Software geared to large labs

Data varies, is highly particular

Good ideas are out there

IACUC INTEGRATION

Calvin needs IACUC approval to perform experiments on mice in his next study... In addition to the usual protocol summary, Calvin must list the particular strains of mice he intends to use and the source of those mice.

The mice strain information is exported in electronic format and sent to eagle-i for processing.

FIND A MOUSE NEARBY

Before budgeting for relatively common mice, Calvin logs onto eagle-i to check if investigators at his institution are already using them. He finds three potential leads.

To protect the identities of investigators who use animals, eagle-i does not display contact information; instead the mouse resource page displays a simple contact form that will confidentially forward Calvin's sharing request to the resource's owner.

In the end, one investigator responds directly to Calvin to share his mice, saving Calvin time and money.

FIND SEMINAL SOURCE OF A MOUSE

Calvin reads about an innovative study in a leading neuroscience journal that uses a mouse model about which he's unfamiliar. He checks PubMed for details, but it is unclear from the article if the authors created the model themselves. Calvin continues his search on the eagle-i website. He enters the PMID of the article he read and retrieves a list of related mouse models with links to the originating investigators.

PUBLICIZE YOUR MOUSE

Caroline created a new mouse model last year that's proving to be quite popular. She has just transferred the model to a private lab which will fulfill requests for it from the general research community. She'd like to eliminate many of the direct requests she receives by e-mail and phone, so she logs onto Eagle-I and searches for her mouse model. Finding it, she updates the model's meta-data with contact information for the private lab.

"YELP" FOR CORES

Sandra goes to the eagle-i site and searches for "FACS cores." She gets a list of cores in order of proximity to her institution. She clicks the link of one core's page. It displays a description of the core, a list of its services, internal and external costs, and average turnaround time. Beneath, the page lists brief reviews by other scientists who have used the core. She returns to the results list and resorts it by cost, then by turnaround time. She also bookmarks her results page and the pages of the facilities that appeal to her most.

"MATCH.COM" FOR MANAGEMENT TOOLS

Sandra finally has some extra time to look into lab organization tools, but she balks at doing a whole lot of Googling. She instead goes to the eagle-i "Get Organized" section and enters a little information about her lab. Sandra gets back a list of tools submitted by other researchers that match her criteria. Luckily most tools are free, and some include comments from researchers that have used them. She can easily click through to download a template or software package. She bookmarks her favorite results to show to this lab members at their Friday meeting.

WRAPPING UP

IDEA "GRAB BAG"**Promote sharing policies**

Categorizing the general types of sharing policies, and publishing the sharing policy linked to the IRB information would increase the transparency of data sharing in human health research and allow researchers to determine where data sharing is more welcome.

IDEA "GRAB BAG"

Knowledge exchange about animal
core best practices.

Small and remote institutions have similar animal
resource core management problems. Within this
category some have solutions that could be shared with
others.

THANKS!
