INDIVO 4

Mockup: Dashboard

An Indivo user is shown his Dashboard immediately upon logging in to his account. The Dashboard's goal is to assist the user with his most common health tasks, and alert him to actions he should take to improve his own and his family's health.

At the top, a list of Alerts includes all critical events and messages generated by Indivo and the user's third-party applications.

The Dashboard serves as a gateway to an ecosystem of health applications supported by the Indivo platform. Beneath Alerts, we list all the user's third-party applications, and include a link to a directory other available applications.

The user's family is most often the center of his health concerns, and the Dashboard provides links to all family members' records he can access through Indivo.

The user's healthcare support network naturally extends to his care professionals. The Dashboard provides links to the user's health professionals' contact information. If a care provider has an Indivo account, additional communication and collaboration features will be available.

The News Feed summarizes all activity within the user's health network: data coming into his and his family's accounts, doctor's visits, and any comments posted to his health record.

Mockup: Health Profile

The Health Profile provides a complete overview of the data available in a user's health record.

The News Feed displays the most recent changes to the user's health record. When appropriate, News Feed items link to more detail. Should the user wish to see a slightly longer history, the "Show more items" link will dynamically extend the News Feed further into the past.

INDIVO 4

Mockup: Medication Input, Step 1

Medication input in Indivo 4 offers significant improvement over previous versions of Indivo and competing products. We present the user with a three-step process for gradually eliciting details about the medication he would like to add, asking in the order “What?”, “When?”, and “How?”

Progress indicators make it clear to the user what steps are involved in adding a medication, and give him clear feedback about his completion of input tasks.

Our first step requests the name of the medication. The user may type in a free-form response or select from a list.

Free-form responses will be aided by dynamic suggestions shown below the input field as the user enters the first few letters.

The user may choose from a list of medications. We will list both brand and generic drug names. The primary list will be divided by first letter; links above the list allow the user to choose a letter to list. To the right of the list, the user may choose to filter by disease type. The disease types have been generated from the 300 most commonly prescribed medications in the United States.

If the medication is chosen from a suggestion or list, we can customize the next two screens with only options (e.g. route, strength, dosing) appropriate for the selection using third-party drug databases that provide such data.

RxList, *Top 300 Prescriptions for 2005 by Number of US Prescriptions Dispensed*

INDIVO 4

Mockup: Medication Input, Step 2

In this step, we ask the user to describe when this medication is used.

We first distinguish between currently-used and formerly-used medications, and then ask for details about frequency and duration with terms a patient will understand.

The start and end date fields will accept imprecise dates to reflect a patient's mental model about how he uses medications, i.e. "I took that drug for a few months last year."

The headings are dynamically generated to remind the user about whom he is entering this information, e.g. "When does Daniel use Lisinopril?" or "When do you use Prednisone?"

Mockup: **Medication Listing**

An example of a document listing.

Each item indicates its source (user or data source) and the number of related comments that have been posted.

Each item contains a concise summary of detail data.

Obsolete items are relegated to the bottom of the list.

Ideally, we will provide a link to download a printable version of the medication list for sharing with family and care providers.

Mockup: Medication Tagging

When the user clicks the “add/change” link next to a document’s tags, the page dynamically displays an input field loaded with tags for modification.

Tags are separated by commas, and the system will dynamically suggest tags as the user types, drawing from tags already used in his record.

The “save” button will asynchronously update the document’s tags and restore the detail display.

INDIVO 4

Mockup: Lab Tests Listing

Indivo’s lab test listing addresses what we expect will be the most common use case: a patient checking his record for the results of a recent test. As such, the data is listed in colloquial buckets: “this week,” “last week,” and “last 6 months.”

Controls are provided to access older tests from previous years, but our assumption is that the value of most lab tests has a short half-life (unless, perhaps, tests are visualized graphically for a historical perspective).

Tests names are displayed with a single numerical result of the test, or with summary information describing the number of related individual tests involved and the total number of abnormal results.

When possible, brief textual results will be displayed in the list, lessening the need for the user to view test details.

Hematocrit Hematocrit is a measurement of the proportion of blood that is made up of red blood cells. The result rises when the number of red blood cells increases or when the plasma volume is reduced, as in dehydration. The hematocrit falls to less than normal, indicating anemia, when your body decreases its production of red blood cells, or increases its destruction of red blood cells, or if blood is lost due to bleeding.

Urinalysis The urinalysis is used as a screening and/or diagnostic tool because it can help detect substances or cellular material in the urine associated with different metabolic and kidney disorders. It is ordered widely and routinely to detect any abnormalities that should be followed up on. Often, substances such as protein or glucose will begin to appear in the urine before patients are aware that they may have a problem. It is used to detect urinary tract infections (UTI) and other disorders of the urinary tract.
